Continuation of 11. does NOT place the application in condition for allowance because: Applicant states that "the addresses... have no connection whatsoever to an instruction sequence of a microprocessor". Examiner disagrees. The address decoder creates addresses based on a counter which is based on a gated (by signal 217) clock signal. Signal 217 is created by Event sequencer logic 232 based on a number of different signals including signal 214 which in turn is based on signals 212 which is based on the instruction stream in the processor (as shown in the Final Rejection). The claim makes no mention of how the first specific events are dependant on the instruction sequence. Clearly, if no instructions are being executed, signal 217 will never change and no addresses will be sent to the address decoder. Regarding the limitation "including determining the instruction sequence executed by the microprocessor", Examiner disagrees. The claim merely states that the first and second messages are processed by the analysis tool in order to determine the instruction sequence. Clearly, the trace array 207 determines the instruction sequence (by definition, a trace is a sequence of instructions). The trace array would not operate without all control messages being sent to it. Therefore, the first and second messages (control signals for the trace array) are sent in order to make the trace array function and therefore they are sent to determine the instruction sequence. The claims do not impose any limitation on how the messages are used or what information the messages contain.
